4.3 Status

It represents the status of the process, the value “In progress” is automatically proposed (Figure 1).

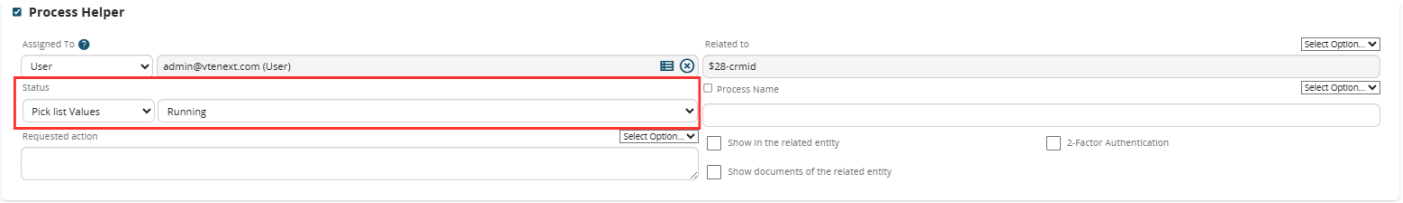

Figure 1

NOTE: from the moment a process helper is activated within a process, from that moment on the management of the state becomes “manual”, therefore it will be managed until the end through the use of other process helpers.

Specifically, within each single configured EndEvent, it will be necessary to activate a process helper to force the state to “Terminated” in order to correctly close the process (Figure 2).

Otherwise, the process will still end its flow but the “Status” will remain “In progress” creating potential inconveniences for the assigned users.
