ListView extendability

The `ListViewController` class has been refactored to be more perfomant and easily extendable.

For example, now it's much easier to add new icons into the *Actions* column:

```
SDK::setClass('ListViewController', 'ListViewControllerCustom',
'modules/SDK/src/CUSTOMER/ListViewControllerCustom.php');
```

And the class:

```
<?php

require_once('include/ListView/ListViewController.php');

class ListViewControllerCustom extends ListViewController {

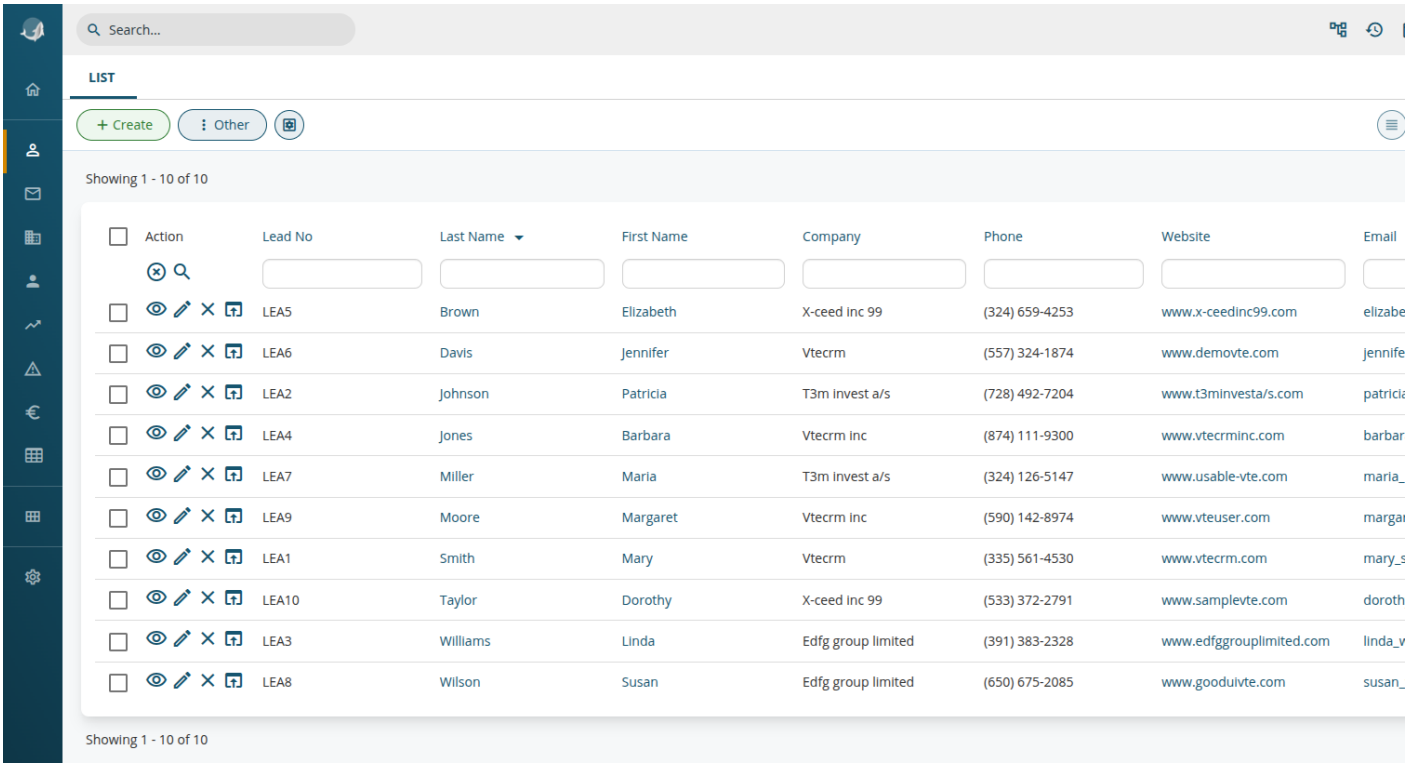

/**
 * Generate an array of strings to be concatenated and set as the "action" column
 */
public function generateActions($focus, $recordId, array $sqlrow = [], $navigationInfo = []) :
array {
$actionLinkInfo = parent::generateActions($focus, $recordId, $sqlrow, $navigationInfo);

$module = $focus->modulename;
if ($module === 'Leads') {
// add an icon to each lead to open the record in the erp:
$actionLinkInfo[] = "<a href=\"https://myerp.example.com/lead/$recordId\" target=\"_blank\">
class=\"vteicon\"'>open_in_browser</i></a>";
}

return $actionLinkInfo;
}

}
```
