

Standard PHP replacement

You can replace the standard php files of the modules, such as DetailView.php, EditView.php and so on through the method:

```
SDK::setFile($module, $file, $newfile);
```

\$module : the name of the module

\$file : the value of the "action" parameter to be compared

\$newfile: the new php source, without extension and without path

The *\$newfile* must be in the same folder of the module and must be specified without an extension and without a path.

If you want to replace the ListView, you must call setFile twice, once with `$file = "ListView"` and once with `$file = "index"`.

To remove the customization:

```
SDK::unsetFile($module, $file);
```

\$module : the name of the module

\$file : the value of the "action"

Hooks:

include/Ajax/CommonAjax.php
index.php
