

Google Authenticator Mode

From the settings it will also be possible to select the OAuth2 authentication mode towards Google:

- Proxy (default): The authentication will occur through Pantarei Informatica servers, which will act as a bridge with Google Cloud. This mode is recommended for most scenarios.
- NATIVE: The client will register its own authorization token in their Google Cloud panel, which will verify the company and authorize the return domain. This mode is recommended for those who already have their own Google Cloud panel.
