Release Note vtenext 26.10.1

Shared mailbox support

Added support for shared mailboxes, including Microsoft 365 shared mailboxes using OAuth2 authentication.

The authentication account can now be configured separately from the shared mailbox and sender address. Support covers mail server settings, the Messages module, Mail Converter and newsletter bounce handling.

Newsletter tracking consent

A new **Newsletter tracking consent** field is available in Leads, Accounts and Contacts. Tracking is disabled when consent has not been provided.

Open and click tracking now distinguishes between recipients who have enabled consent and those who have not. For recipients without consent, statistics display anonymous aggregate counts.

The **Preference management link**, previously labelled Unsubscription link, also allows recipients to manage tracking consent separately from their newsletter subscription.

The preference is associated with the email address and shared across records using that address. When saving a record, confirmation is required before revoking consent already associated with the same address.

Enable the Kitt assistant for individual users

A new **Allow AI Assistant interactions (Kitt)** field has been added to user preferences.

When this option is disabled, the user cannot see the assistant widget or its conversation tab and cannot send messages to Kitt.

MCP tool annotations

Support for MCP annotations has been extended to custom tools and tool-type processes.

Annotations can describe whether a tool is read-only, potentially destructive, idempotent or interacts with external systems. MCP clients can use this information to classify tools and manage approval requests.

For custom tools, annotations can be provided through `SDK::setMcpTool()`.

Data export before uninstalling modules

The uninstall procedure for modules created with Module Maker now explicitly states that uninstalling also deletes the module’s data.

If the module contains records, they must be exported to CSV before uninstallation can be confirmed. Modules without records can proceed directly to confirmation.

Price book support in the app

Added support for the Price Books module in the app, with read-only access and support for related reference fields.

A price book can be selected in the product block to apply the price associated with a product or service. The selection displays active price books matching the document currency and the selected product.

Review SDK files skill improvements

Improved the identification of custom PHP files to review for compatibility with vtenext 26 and PHP 8.3.

File selection takes configured exclusions into account, together with files and directories scheduled for removal by the update package. The standard file manifest is downloaded from the vtenext repository without requiring direct SVN access.

Security updates

- **Licence management:** corrected licence update checks to prevent unauthorised requests that could invalidate the licence and block access to the CRM.
- **Data access permissions:** strengthened checks when composing Emails, SMS and Faxes, validating record access, field visibility and the requested data type.
- **AI tool connections:** extended network destination checks to LLM, MCP and agent clients. When local network access is disabled in the security configuration, connections to internal hosts and invalid URLs are rejected.
- **Libraries:** updated phpseclib to version 3.0.57 and react/http to version 1.11.1.
