

vtenext 25.02.1 Release Note

New BPMN Action to Set the "Receive Newsletter" Field

Among the SDK functions for BPMN actions, a new function called **Set receiving newsletter** has been added. This allows enabling or disabling newsletter reception for a specific record.

The screenshot shows the configuration for a BPMN action titled "Lock newsletter". The SDK Function is set to "Set receiving newsletter (lead/contact/account, lock/unlock)". Under "Additional parameters", there are two entries: one with parameter value "\$9-crmid" and ID selected from a dropdown, and another with parameter value "lock" and "Select Option..." selected from a dropdown. There are trash icons next to each parameter entry and an "Add parameter" button at the bottom.

Option to Enable Logging of All Sent Emails

By activating the `modules.emails.send_mail_log` property, all sent emails will be tracked in the `vte_send_mail_log` table.

This can be useful for analyzing outgoing email traffic.

Newsletters are excluded from this log.

The information stored in the table includes: sender, recipients, subject, send date, status, and error.

There is no built-in retention logic, so it's up to those who enable this configuration to clear the table after completing their analysis.

Text Preview Limit in List View

If a text field in a module list filter exceeds 40 characters, the text is truncated and an icon appears that shows the full text on hover.

To improve list performance, we've decided to also truncate the text inside the "tooltip" based on the value of the `performance.listview_moreinfodiv_lengthlimit` property, which by default is set to **100,000 characters**.

Business Unit in Newsletter Creation Wizard

For those who have activated the **Business Unit** module and have the `bu_mc` field in the Campaigns module, it is now possible to set this field directly within the **Newsletter creation wizard**.
