

17.11 Encrypted Field Editor

The encrypted field editor allows you to protect the content of a field by means of an access password. The user can only access the contents of the field after entering the password.

The screenshot shows the 'Settings > Encrypted fields' page. On the left is a dark sidebar with icons for home, list, user, document, chart, globe, and key. The main area has a header with a lock icon and the text 'Settings > Encrypted fields' and 'Encrypted Field Editor'. Below this, it says 'No encrypted fields. Click Add to create a new one'. In the top right corner, there is a light blue 'Add' button.

Choose the module and the field of interest and enter the password:

This screenshot shows the same interface as the previous one, but with the form fields filled out. Under 'Choose a field to encrypt:', the 'Module' dropdown is set to 'Accounts' and the 'Field' dropdown is set to 'Description'. Under 'Choose the password used to decrypt it:', there are two password input fields, both filled with dots. In the top right corner, there are two buttons: a light blue 'Create' button and a red 'Cancel' button. At the bottom left, an alert message reads: 'Alert: If you forget the password, data will be lost and cannot be recovered.'

Warning! If you forget your password, the data can be recovered through technical assistance.
