

8.1.1 Products bundle

You can create and manage product bundles by defining parent-child type inter-product relationships. Product bundles are useful when managing complex products, meaning “parent” products composed of multiple single “child” products.

For example: a fully assembled computer could be classified as a single product because it can be sold ready and assembled by your organisation. Frequently however, it is the customer who wishes to choose the components, in which case a bundle of products must be defined.

The relations menu in the product record contains the Bundle Products (single products) box and the Parent Product Box (showing the main product to which the current product relates). This hierarchy is used to create quotes, sales orders and purchase orders.

To create a bundle you need to access the parent product record and, in Product Bundle, select Add (to create a new product) or Select (to link a product already present in the database).

The parent product will appear in the child product record as shown in the figure:

The screenshot shows a CRM interface with a sidebar on the left and a main content area. The main content area is titled 'Notes - Slider' and contains a large document icon. Below it is a table titled 'Products (1) - List' with the following data:

Action	Product Name	Part Number / SKU	Commission Rate (%)	Qty/Unit	Unit Price
	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
	Assembled PC		15	0	€ 750.00

The 'RELATIONS' sidebar on the right contains a list of items, with 'Parent product' highlighted in a red box. A red arrow points from 'Parent product' to the table, and another red arrow points from the table to the 'Notes - Slider' area.

Warning! The price of the parent product is not equivalent to the sum of the prices of the child products because the single prices are defined freely.
