16.6 Access Field

The available function is used to control the visibility of the fields in the various modules on the part of the entire organisation. You can use this function both to show and to hide selected fields. By default, all fields are considered visible. It is not possible to disable the mandatory fields of the modules.

Warning! The Access Fields rules prevail over the rules set by the Profiles except for the ADMIN user who will see them all, even if they are disabled.
