	Download attachment
	File attachment as a CRM document / View document tab
	Link document to an object in vtenext

	Open attachment preview (supported extensions: odt, pdf and common image formats)
---	---

Emails can be linked to CRM modules by means of the Link function:

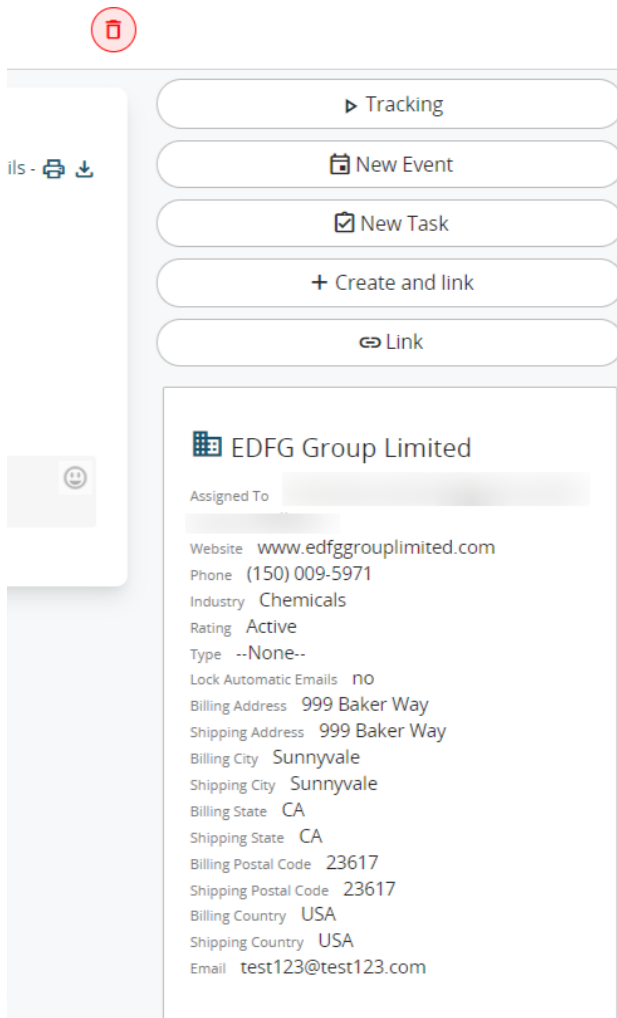

Through the “Link” function it is possible to relate the emails to the CRM modules:

The system suggests possible links automatically based on the sender's email address. You can edit the “Filter” item to extend to search also to include results beyond the suggested ones. The “Recents” button, which is accessible from the “create and link” function, allows you to access the modules most recently visited.

If you can't find a match with an existing element, you can create a new record (for example a new account) by means of the “Create” button.

Once the connection has been made, it will be highlighted with the symbol , which will be visible both in the email list view and in the email detail with an indication of the linked record.

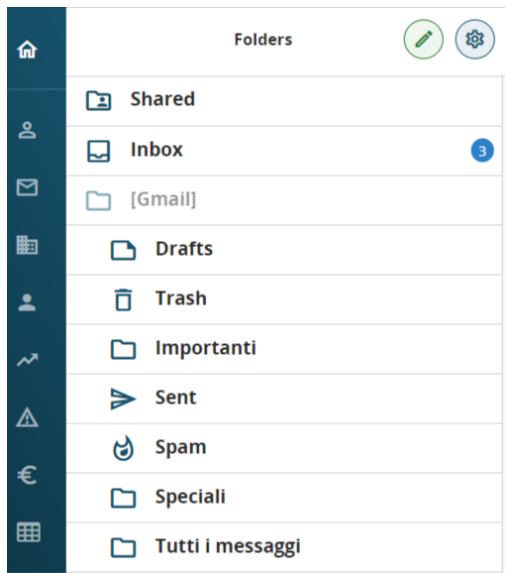

Linked emails will be also visible in the records, via Relations > Messages. Visibility of emails is subject to the Sharing Access configuration (Linked Messages module item).

Display the folders in the email inbox.

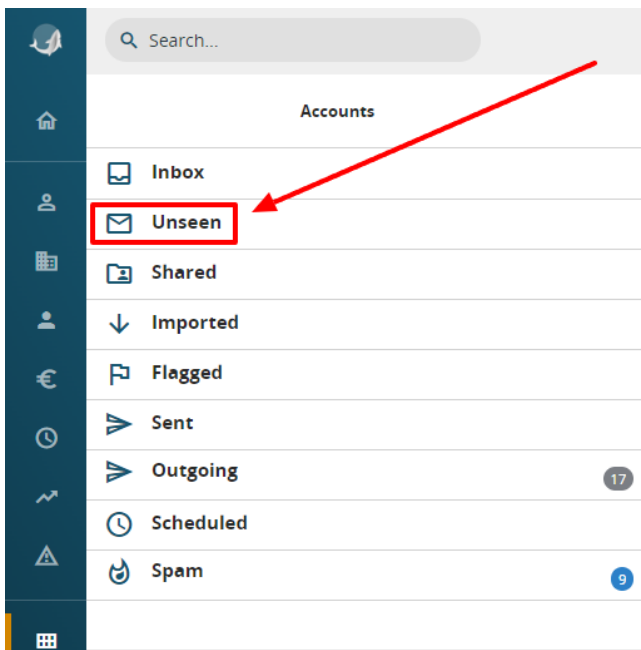

To view all the folders of an email inbox, simply click on the arrow located at the top left of the Messages Module, as shown in the following image.

After that, the complete list of available folders, previously created either directly from the browser or from another email client, will appear.

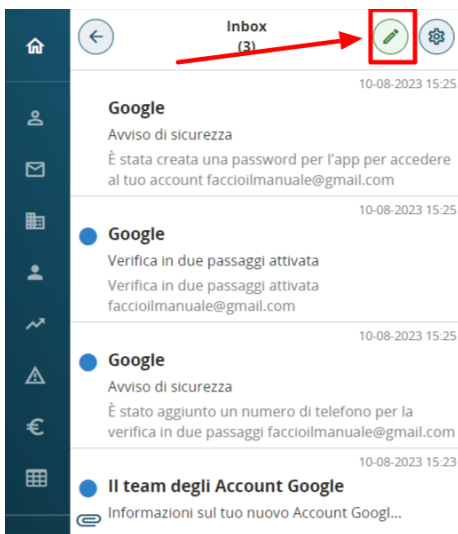

The "UNSEEN" email folder has been added to the list of folders for convenient searching and access to emails.

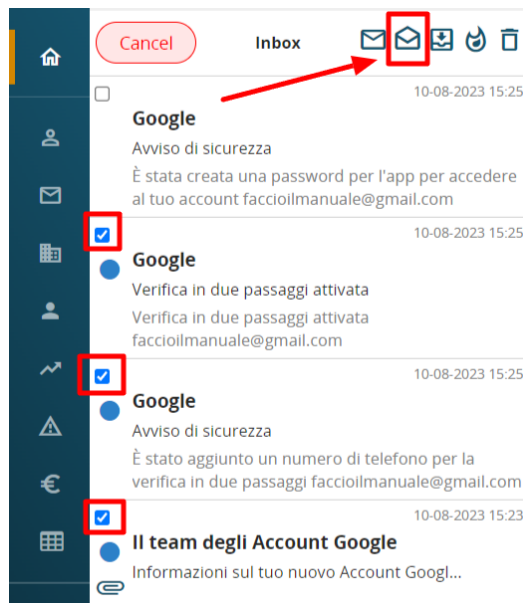

Mark all emails as read.

To mark all emails as read, it is essential to follow these simple steps:

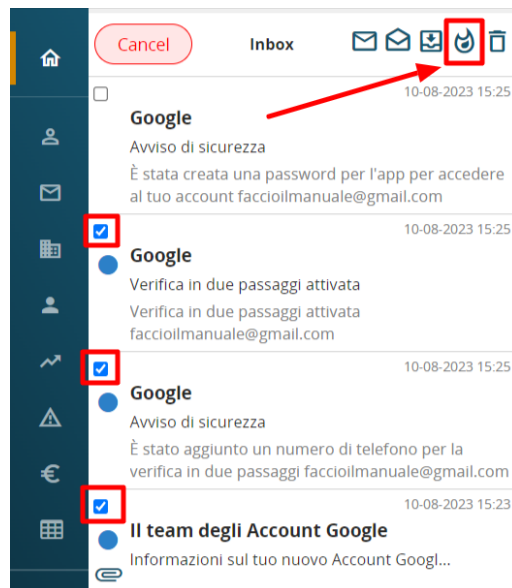

1. From the left column of the Message module, click on the edit icon (pencil) as indicated in the image below.

2. Finally, select all the emails you wish to mark as READ and click on the MARK AS READ icon, as indicated in the image below.

Using the same method, you can also bulk mark emails as SPAM/JUNK by clicking on the flame icon, as shown in the image below.

You can search for messages using the search function located in the top left corner. Additionally, you can conduct searches that include subfolders.
