

15.7 Synchronization with Zapier

Zapier is a product that allows end-users to integrate web applications and automate workflows. It enables the connection of various web applications through "ZAPs," which can be customized based on user needs. Zapier functions as a bridge between different applications, allowing the automation of business processes and saving valuable time.

The guide to create a Zapier integration is available here:

<https://usermanual.vtenext.com/books/creation-of-external-apps/chapter/zapier>

Name of the fields in vtenext

In the linked tutorial several internal field names of vtenext have been used. These names are not normally visible from the web interface, so a special page has been prepared, where all field names can be seen, to be used in integrations using the API.

To see them, go to **Settings -> REST Webservices** and click on **Show**:

Settings > REST Webservices

To connect an application to **Vtenext** use the following parameters:

Endpoint:

User Name:

Webservice access key: [View](#)

Modules and fields usable: [Show](#)

For more info [click here](#)

Configure external Web services to be used with processes

[+ Add Webservice Client](#)

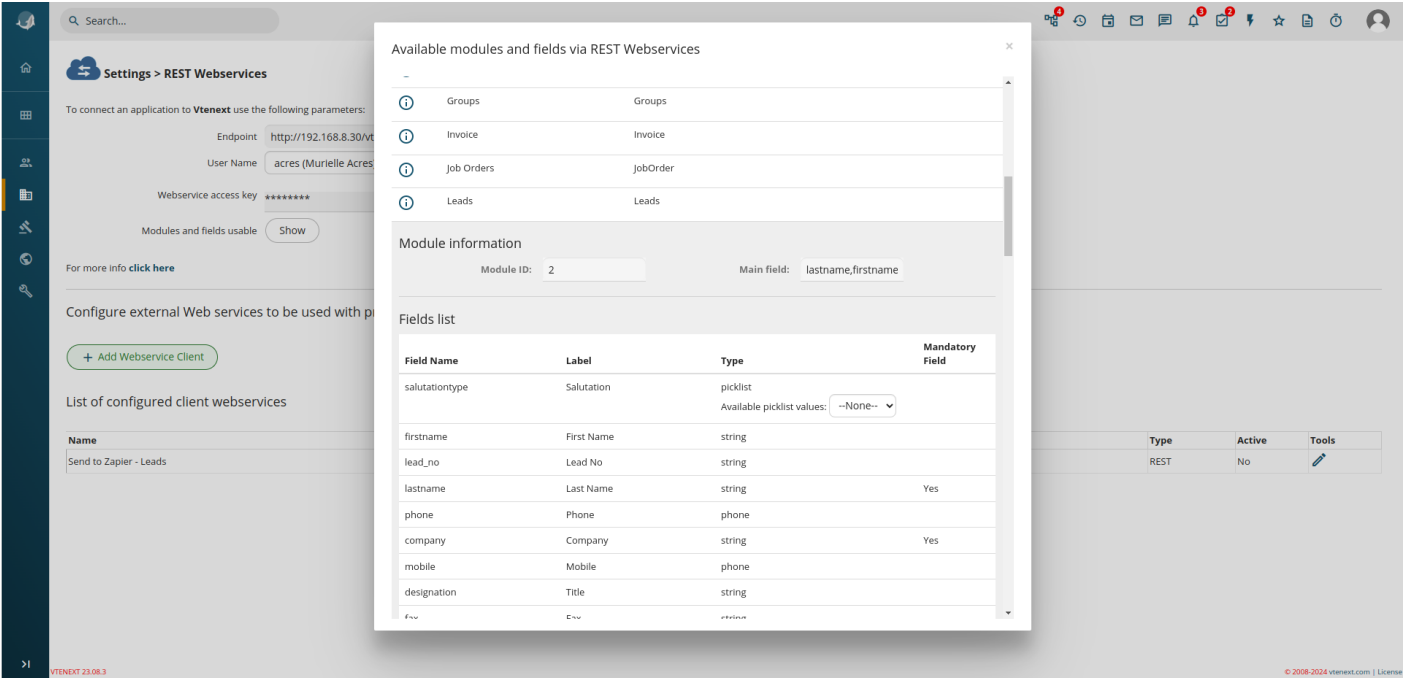

List of configured client webservices

Name	Description	Type	Active	Tools
Send to Zapier - Leads	ZAP ID subscription:39627093	REST	No	✎

PTENEXT 23.08.3

© 2008-2024 vtenext.com | License

A popup will open, showing the id of the modules and field names:
